### FEATURES & BENEFITS

Five Chamber diaphragms for smooth and quiet operation

High quality TTI micro pressure switch

Self-priming up to 6 feet (1.8 m)

NPT Connector, better seal

Complies with USCG 183.410 and ISO 8846 MARINE (Ignition Protection)

Lower batter drain, quiet operation, long pump life

Can be installed vertically or horizontally

### FEATURES & BENEFITS

- Smoother flow, quieter water systems.
- Maintenance free potable water quality accumulator tank.
- Five chamber diaphragms for smooth and quiet operation.

## Reading A Serial Number

DP222005000499012			
Section 1	Section 2	Section3	Section 4

### Section 1.

Type of pump and Model. (Diaphragm Pump Model-22 series)

### Section 2.

Year and month of manufacture (2005 = 2020/05 May)

### Section 3.

Number in production Batch (No. 000499)

### Section 4.

Voltage (12Volt 012)

## Trouble Shooting Guide

### 1. Pump will not start or blows the circuit

\*The first thing would be to look at the electrical circuit. This includes checking the fuse, switch, circuit breaker, and the earth. If you are running off batteries, make sure you are obtaining correct voltage.

\*Check to see if the pump is hot. It could simply have stopped due to the thermal breaker being triggered. Wait until it cools down.

\*If your pump has spent the night in below freezing conditions such as those experienced in some parts of alpine Australia, it could be that the water against the pump diaphragm has frozen causing it to seize. Wait for it to thaw.

\*If you have voltage present at the switch, try bypassing the pressure switch. Does the pump operate?

\*Check your pump is getting correct voltage.

### 2. Pump runs but will not prime and splutters

\*Check the water level of your tank. It is not as silly as it sounds.

\*It is common that the strainer or inline filter has become clogged with foreign debris. If this happens it will stop the flow of water to the pump. Simply clean or replace the filter

If you are using a hot water system, air could have built up within your hot water tank producing an air lock. Release the pressure from your tank, refer to your HWS owner's manual.

\*Check your plumbing connections. If they have become loose, they could very well be causing a vacuum leak.

\*Check your hose to make sure no kinks have appeared, and that all your valves are functioning correctly.

### 3. Pump rapid cycles

\*The major cause of rapid cycling is restrictive plumbing. This can be restrictive taps and shower heads or kinked hoses.

\*If you are running a water filter or purifier then this should be installed on a separate line feed. Do not purify all your water.

### 4. My pump will not shut off or runs when taps are closed

\*Check your plumbing's pressured side for leaks, dripping taps, or if you have a plumbed

\*Check your pump is receiving the correct voltage.

\*Check the pump head screws have not worked loose.

\*Possible debris is causing valves to stay open.

### 5. Pump is noisy or running rough

\*Check plumbing has not worked loose or become kinked

\*Clean out your strainer from any foreign debris.

\*Is your pump plumbed using flexible hose and mounted correctly?

\*Bleed your plumbing system of any air.
